Prompt: Evaluate the bug severity : The recent patch fixed the memory leak , but unfortunately triggered a catastrophic silent failure within the garbage collector .

Generated: *Okay, let's break down the severity of this bug. Here's a breakdown, categorized and ranked with explanations: **Severity: High - Critical/Major** **Reasoning:** * **Catastrophic Silent Failure:** This is the *most* significant factor. A silent failure means the system is completely unresponsive, and the user doesn't even realize something is wrong. It's not a simple error message; it's a complete halt. * **Memory Leak:** A memory leak is a serious problem. It indicates a fundamental flaw in the code that causes the application to consume more and more memory over time, potentially leading to crashes, performance degradation, and eventually, system instability. * **Patch Fix:** The patch *did* address the leak, which is a positive step. However, the *consequence**
