Prompt: Evaluate the bug severity : The recent patch fixed the memory leak , but unfortunately triggered a catastrophic silent failure within the garbage collector .

memory → leak +0.22

leak → memory +0.16

the → bug +0.12

evaluate → bug +0.11

severity → evaluate +0.10

evaluate → severity +0.10

silent → catastrophic +0.10

failure → silent +0.09

Generated: Okay, let's break down the severity of this bug. Here's an evaluation, considering the details provided: ***Severity: Critical / High** Here's a detailed breakdown of why: * **Silent Failure:** This is the **most** concerning aspect. A silent failure means the application didn't crash, log an error, or provide any immediate indication of the problem. Users likely wouldn't even realize something was wrong until the application stopped working entirely, or data became corrupted. This is incredibly difficult to diagnose and can lead to significant user frustration and data loss. * **Catastrophic:** The term "catastrophic" suggests the failure is severe and potentially widespread. It likely involves a significant portion of the application's state being corrupted or lost. * **Garbage Collector Issue:** Garbage collectors are fundamental to memory management*
